

DRainAGE1. Drainage :-

- Drainage describe the river system of an area.
- The area drained by a single river system is called a drainage basin.
- Any upland or a mountain separating two adjoining drainage basin is known as water divide.
- The world largest drainage basin is of the Amazon river.
- The Ganga basin is the largest basin in India.

(2) The Drainage System in India :-

- The Indian Rivers are divided into two major Groups.
 - The Himalayan rivers.
 - The Peninsular rivers.
- Features of Himalayan rivers :-
 → These are Perennial (Flow all year) (Delta)
 → These rivers receive water from rain as well as from melted snow from the lofty mountains.
 → The Himalayan rivers have long courses from their source to the sea.
 → The Himalayan rivers form meanders, oxbow lakes and many other depositional features in their flood plains.
- Features of peninsular rivers :-
 → They are seasonal.
 → Their flow is dependent on rainfall.
 → The peninsular rivers have shorter and shallower courses as compared to their Himalayan rivers.

→ Most of the rivers of peninsular India originate in the Western Ghats and flow in the Bay of Bengal.

⇒ Drainage Patterns:

- The streams within a drainage basin form certain patterns, depending on the slope of land, underlying rock structure as well as the climatic condition of the area.
- Types of Drainage Patterns:
 - Dendritic Drainage
 - Trellis Drainage
 - Rectangular Drainage
 - Radial Drainage

⇒ The Himalayan Rivers:

- The Indus, The Ganga and the Brahmaputra are major Himalayan River.
- A River along with its tributaries may be called a river system.

⇒ The Indus River System:

- Source: The River Indus rises in Tibet, near Lake Mansarovar.
- It enters India in the Sikkim district of Jammu and Kashmir flowing west.

• Tributaries of Indus:

- The Zaskar, The Nubra, The Shyok and the Hunza join it in the Kashmir region.

- The Satluj, The Beas, The Ravi, The Chenab and The Jhelum join together to enter the Indus near Mithankot in Pakistan.

- The Indus plain has a very gentle slope.
- Total length: 2900 km.
- A Third of the Indus basin is located in India in the states of Jammu & Kashmir, Himachal Pradesh and the Punjab and the rest is in Pakistan.

The Ganga River System:

- Source: The headwaters of the Ganga, called the 'Bhagirathi' is fed by the Gangotri Glacier.
- Tributaries of Ganga:
 - Alaknanda joined at Devprayag in Uttarakhand.
 - The Yamuna rises from the Yamnotri Glacier in the Himalayan joined at Allahabad.
 - The Ghaghara, The Gandak and the Kosi rise in the Nepal Himalaya.
 - The Chambal, The Betwa and the Son rise from the semi-arid areas..
- The River bifurcates Farakka in West Bengal
 - The Bhagirathi-Hooghly (a distributary) flows southwards through the deltaic plains to the Bay of Bengal.
 - The mainstream flows southwards into Bangladesh and is joined by the Brahmaputra.
- Total length: 2500 km.
- Sunderban Delta: The delta formed by the rivers the Ganga and the Brahmaputra is known as the Sunderban Delta.

(4)

⇒ The Brahmaputra River System:

- Source: The Brahmaputra rises in Tibet east of Mansarovar Lake very close to the sources of the Indus and the Sutlej
- Tributaries of Brahmaputra:
 - Dibang, the Lohit.
 - Flows eastward parallel to the Himalayas, it takes a 'U' on reaching the Namcha Barwa and enters India in Arunachal Pradesh through a Gorge.
 - Here, it is called the Dihing and it is joined by the Dibang the Lohit and many other Tributaries.
 - In Tibet, the river carries a smaller volume of water and less silt as it is a cold and dry area.
 - In India it passes through a region of high rainfall and the river carries a large volume of water and considerable amount of silt.
 - It forms many riverine Island
 - Every year during the rainy season, the river overflows its banks causing widespread devastation due to flood in Assam and Bangladesh.
- # Majuli is the world largest riverine island formed by the Brahmaputra.

⇒ The Peninsular River:

- The main water divide in Peninsular India is formed by the Western Ghats.
- Major River of Peninsula such as the Mahanadi, the Godavari, The Krishna and the Kaveri flows eastwards and the drain into the Bay of Bengal.
- The Narmada and the Tapi are the only long rivers, which flows west and make estuaries.

The Narmada Basin:

- Source it rises in the Amarkantak hills in Madhya Pradesh.
- It flows towards the West in a rift valley formed due to faulting.
- All the tributaries of the Narmada are very short and most of these join the main stream at right angles.
- The Narmada basin covers parts of Madhya Pradesh and Gujarat.

⇒ The Tapi Basin:

- Source it rises in the Satpura ranges, in the Betul district of Madhya Pradesh.
 - It also flows in a rift valley parallel to the Narmada but it is much shorter in length.
 - Its basin covers parts of Madhya Pradesh, Gujarat and Maharashtra.
- * Other West flowing rivers: Sabarmati, Mahi, Bharathpuzha and Periyar.

⇒ The Godavari Basin:

- Source it rises from the slope of Western Ghats in the Nasik district of Maharashtra.
- It is the largest peninsular river.
- Tributaries of Godavari.
 - The Purna, The Wardha, The Pranhita, The Manjra, The Wainganga and the Penganga.
- The basin covers parts of Maharashtra, Madhya Pradesh, Odisha and Andhra Pradesh.
- It drains into Bay of Bengal.
- Total Length: 1500 km.
- Because of its length and the area it covers, it is also known as the Dakshin Ganga!

⇒ The Mahanadi Basin:

- Sources: The Mahanadi rises in the highlands of Chhattisgarh.
- It flows through Odisha to reach the Bay of Bengal.
- Its drainage basin is shared by Maharashtra, Chhattisgarh, Jharkhand and Odisha.
- Total length: 860 km.

⇒ The Krishna Basin:

- It rises from spring near Mahabaleshwar.
- Tributaries of Krishna:
 - The Tungabhadra, the Koyang, the Ghatprabha, The Musi and the Bhima.
- Total length: 1400 km.
- Its drainage basin is based or shared by Maharashtra, Karnataka and Andhra Pradesh.

⇒ The Kaveri Basin:

- Source: It rises in the Brahmagiri range of Western Ghats.
- Tributaries of Kaveri:
 - Amaravati, Bhavani, Hemavati and Kabini
- Total length: 760 km.
- It reaches the Bay of Bengal in South of Cuddalore, in Tamil Nadu.

Other east flowing rivers: The Damodar, The Brahmani, The Baitarni and the Subarnarekha.

⇒ Lakes:

- India has many lakes which differ from each other in the size and other characteristics.
- Most lakes are permanent while some contain water only during the rainy season.
- Some of the lakes are result of the action of Glaciers and ice sheets, while the others have been formed by wind, river action and human activities.

- A meandering river across a flood plain forms cut-offs that later develop into ox-bow lakes.
- Most of the Fresh Water Lakes are in the Himalayan Region.
→ They formed when glaciers dug out a basin which was later filled with snowmelt.
- The Wular lake in Jammu and Kashmir is the result of the tectonic activity which is the largest freshwater lake in India.
- Artificial lake: The damming of rivers for the generation of hydropower has also led to the formation of lakes such as Guru Gobind Sagar.
- Importance of Lakes:
 - Helps to regulate the flow of a river. During heavy rainfall, it prevents flooding and during the dry season it helps to maintain an even flow of water.
 - Also used for developing hydro power.
 - They moderate the climate of the surroundings.
 - Maintain the aquatic ecosystem.
 - Enhance natural beauty.
 - Helps in developing Tourism and providing recreation.
- ⇒ Role of Rivers in the Economy:
 - From ancient times, rivers banks attracted settlers as water from the river is a basic natural resource essential for various human activities.
 - Rivers are used for irrigation, navigation and hydro-power generation.
- ⇒ River pollution:
 - The demand for water from river is increasing to meet growing domestic, municipal, industrial and agriculture need which naturally affects the quality of water.

- More and more water is being drained out of the (8) River reducing their volume.
- Also a heavy load of untreated sewage and Industrial effluents are emptied into the rivers which affects not only the quality of water but also the self-cleansing capacity of the rivers.
- Concern over rising pollution in our rivers. Led to the launching of various action plans to clean the rivers
